Wall Panel Specification

The wall panelling system is designed as a modular structure with black MFC carcase designed to be fixed back to a wall. The carcase features cut outs and access holes to allow for the ease of wall fixing and cabling of AV and IT infrastructures. The structure is then clad with 18mm decorative panels secured with de-mountable button fixings

The wall panel system is quoted at 2400mm high but the top decorative panel is designed to be adjusted to give a height range between 2400-2600mm. Please ensure you advise us of the finished floor to ceiling height with the order.

AV Module

The AV module has the same MFC carcase but also includes a recessed back panel for the positioning of the monitor. The monitor back panel is supplied with a large cut out to allow the monitor VESA mount to be securely anchored to the wall.

NB Due to the large variations in monitors Eborcraft do not supply the monitor mounting bracket.

Whiteboard

The top 2 decorative panels are swapped for a full size dry wipe board panel mounted on lift off button fix fittings.

Contrasting Panels

To create a contrasting finish, a row of decorative panels can be finished in an alternative finished panel.

CPU Access Door

A matching hinged access door for fitting in a decorative panel to allow easier access to any IT equipment fitted behind the lift of panels.

AV Surrounding Lights

LED light strip fitted to the top and bottom of the recess on the AV module.
